

TASK – 6

Burp Suite

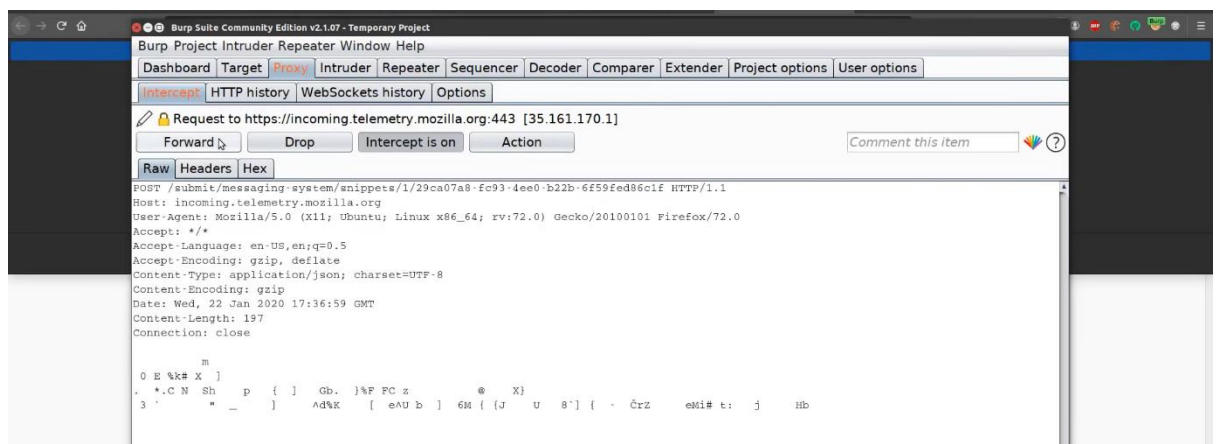

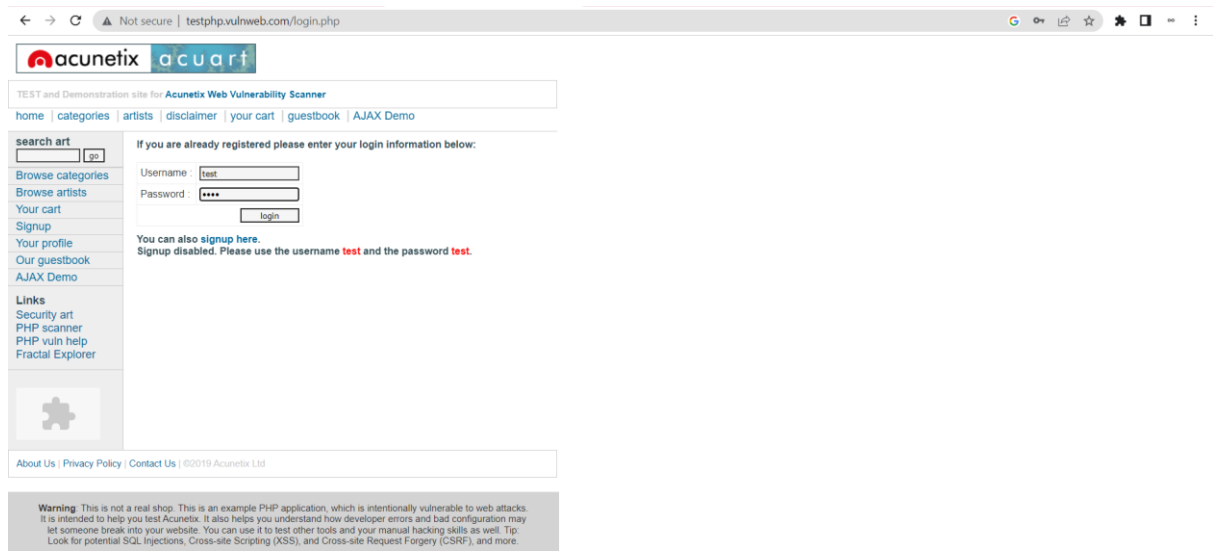

1. **BURPSUITE**

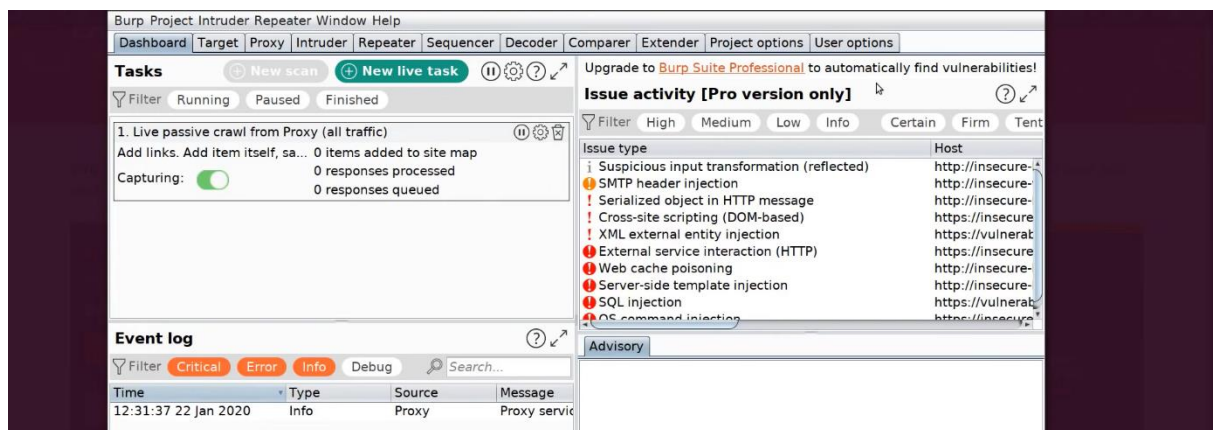

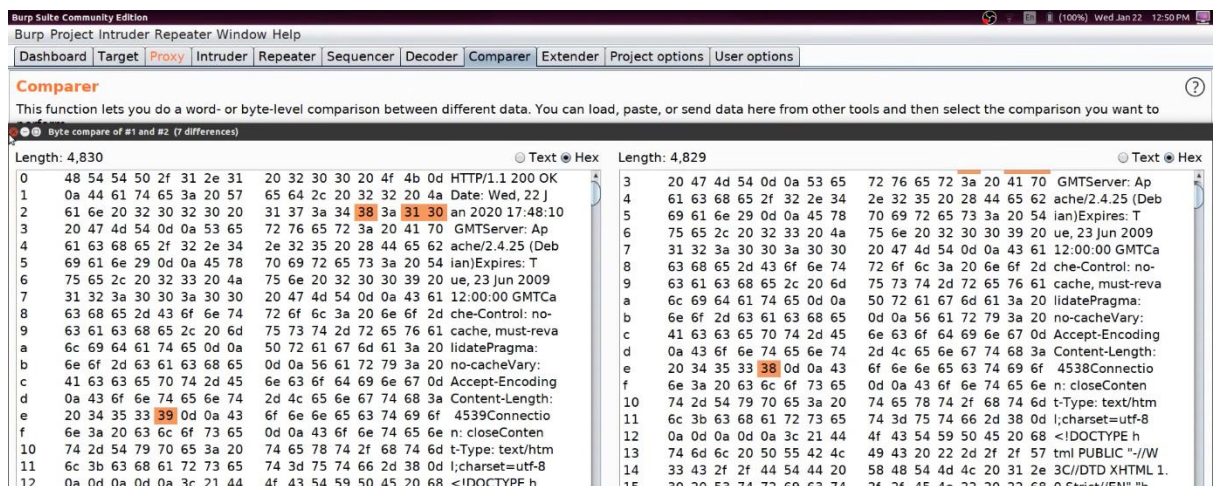

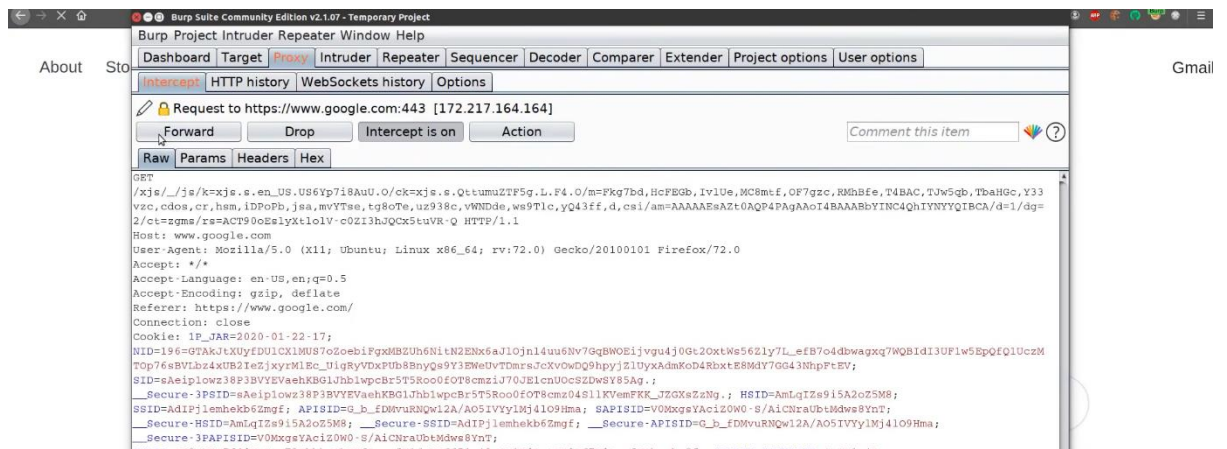

Burp Suite is an integrated platform/graphical tool for performing security testing of web applications. Its various tools work seamlessly together to support the entire testing process, from initial mapping and analysis of an application's attack surface, through to finding and exploiting security vulnerabilities. burpsuite mostly focusses on the tcp connections along with viewing the packages we will be able to manage the packets also.

Capturing packets using burpsuites default browser

- Open burpsuite
 - Goto proxy
 - Click open browser to open the burpsuite default browser.
 - On the browser we will be opening the vulnweb acuart which is a vulnerable website used to practice web hacking - Turn the intercept on to capture the packets.
 - Enter the user name and password on the signup page of the website.
 - At the same time the credentials will be visible on the burpsuite window.
 - In the proxy window itself you will be able to perform many functions to the packets.
 - You will be able to drop and forward packets
 - You can also change the values and apply that in the webpage.
- in this form of session hijacking it is only possible to the websites that we are visiting through the default burpsuite web browser to make the same to happen on the default browser you need to set up the proxy in your system.
- Go to your systems proxy settings

- Ensure that the port is 8080 and ip address is same
- In the burpsuite window go to intercept and turn on
- Now it will start capturing the packets from your default browser also.
- But it will not work with the http and https website as the packets will be encrypted.

Burp Suite is a Java application that can be used to secure or penetrate web applications. The suite consists of different tools, such as a proxy server, a web spider, intruder and repeater.
